Year-over-Year Growth in Total Mining Value

Key Analytical Insights

Fuel Dominance

Fuels consistently account for ~70% of total mining value, with coal alone representing 48% of fuel value — highlighting India's heavy dependence on coal for energy security.

Supercycle Sensitivity

The 2008-09 commodity supercycle drove a 43% YoY spike — the highest in the dataset. This sensitivity to global commodity cycles is a key strategic risk for India's mining sector.

Post-2012 Slowdown

Growth slowed sharply after 2012 and turned negative in 2015-16, coinciding with the global commodity downturn and domestic policy uncertainty in mining allocations.
